Profile

Software engineer combining Java application delivery, nearly five years of software testing and automation at Nokia, and distributed IoT research at UCLouvain. Currently developing Navzeroth, an open-source Rust desktop project. Seeking permanent software engineering work with a security dimension; available immediately for full-time employment.

Skills

Development: Java, Spring Boot, REST APIs, Angular, TypeScript, SQL, PostgreSQL.

Automation: Playwright and Cucumber at Centran; in-house Tcl/Python tools at Nokia; regression testing and defect investigation.

Systems and tools: distributed systems, Erlang/OTP, IoT edge computing, Git, Linux/Unix, Docker.

Current project practice: Rust, Tauri, React, SQLite, Lua, agentic coding and prompt engineering.

Professional Experience

Independent projects & professional development

October 2026–present · Active career break · Belgium

- Developing Navzeroth, an open-source Rust desktop application with local data handling and automated verification.
- Building practical experience with Rust, agentic coding and prompt engineering while pursuing software engineering opportunities.

Java Full-Stack Developer / IT Consultant — Centran

2025–October 2026 · Belgium

- Developed application features with Java and Spring Boot, connecting backend services, APIs and database workflows.
- Worked on Angular and TypeScript interfaces and their integration with backend services.
- Used Playwright and Cucumber for application testing and automation; investigated defects across application layers.

Software QA Engineer — Nokia Bell NV

October 2020–July 2025 · Antwerp, Belgium

- Worked on quality and automation for carrier-grade networking software, including NAT, high availability and failure behaviour.
- Developed and maintained automated tests using Nokia's in-house Tcl and Python tools.
- Reproduced complex defects, investigated system behaviour and verified fixes with development teams; contributed to regression testing and release validation.

Igor Kopestenski

Software Engineer

Professional Experience (continued)

Research Engineer & Project Co-Supervisor — UCLouvain

January 2020–October 2020 · Louvain-la-Neuve, Belgium

- Worked on Achlys, an IoT edge-computing framework using Erlang/OTP and GRiSP; supervised graduate work and integrated debugging into Erlang on RTEMS.

Research Assistant & Developer — UCLouvain · LightKone H2020

September 2018–January 2020 · Louvain-la-Neuve, Belgium

- Developed Achlys components for distributed storage and computation at the IoT edge, including wireless networking and sensor integration on constrained hardware.

Projects

Navzeroth / Azeroth Navigator

Development prerelease · v1.0.0-rc.1

- Open-source desktop companion for World of Warcraft: Forever: imported character snapshots, planning, atlas and session review.
- Modular Rust workspace for core logic, ingestion, local-data processing, storage and CLI; Tauri/React interface, SQLite and a Lua addon.
- Explicit local imports; profiles remain local, imported Lua is treated as data, and the desktop does not access game memory or automate input.
- Hands-on Rust learning, agentic coding and prompt engineering with review and automated verification. Early interest includes contribution offers, shared datasets and alpha testing; full game-content coverage and live-game/Windows validation remain in progress.

Source & releases: https://github.com/Laymer/Navzeroth

Cybersecurity

Identified and reported a security vulnerability affecting 14,000+ people.

Education

M.Sc. in Computer Science and Engineering — UCLouvain, 2018.

B.Sc. in Computer Science and Management, cum laude — Institut Paul Lambin, Haute École Léonard de Vinci, 2016.
